Meal Suggestion Bot

Nergis Kurtbash, Audrey Carlisle, Caiden Martos, Riswanth Haris Sundaresh Babu

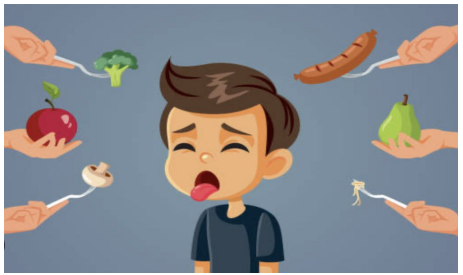

Problem/Idea

The problem we are trying to solve is concerning nutrition.

It might be difficult to find or think of something to eat, for instance while serving little kids who are picky eaters.

It might be difficult to find something that is healthy and that they will eat.

AI can provide a meal based on certain preferences and needs for different people.

Project Idea

We built an AI Chatbot to make suggestions regarding meal choices.

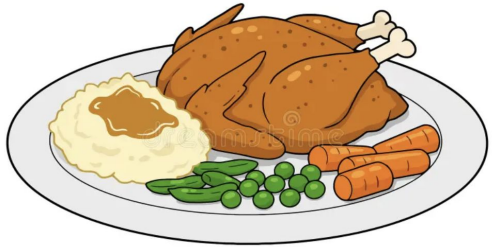

The user can give the AI Chatbot some inputs on preferences and needs and it can help put together a meal for them.

The user can tell what type of food they would like, sweet, savory, if they would like ideas for breakfast, lunch, dinner, and any other needs or preferences.

We can give the AI some different options for food and different criteria and information about those foods to train it.
